The 3D geometry is mathematically represented through
NURBS which stands for ' Non-Uniform Rational B-
Splines ' . NURBS has the potential of precisely describing all
types of digital shapes ranging from circles, arcs, 2D shapes
to 3D solids and highly intricate freeform organic surfaces.

The algorithms are implementations of the pseudocode in Appendix C of An Introduction to NURBS. Here the algorithms have been loosely translated into a 'real' programming language, i.e., C. Hopefully, the availability of the algorithms in C will increase your understanding of the algorithms and hence of the underlying mathematics.

An Introduction to Nurbs: With Historical Perspective by ...

Nonuniform rational B-splines (NURBS) are used in modeling curves and surfaces such as animated objects, aircraft wings, or other engineering parts. The basic idea is to produce a patchwork of pieces of mathematically simpler curves or surfaces that, when joined in a suitably smooth fashion across boundaries, closely approximate the object being
