Density of NAND memory is much higher than density of NOR flash memory. NAND flash memory density is now until 512Gb available, at the same time NOR flash memory is only up to 2Gb. NAND and NOR flash memory structure is based on erase blocks. Smaller the block size – faster erase speed. However smaller blocks are, the bigger amount of them is needed and bigger the die size of the flash memory. NAND memory is usually read with pages (inside the block structure) to reduce the read time.

NOR vs. NAND flash memory: What companies need to know

NAND Flash memories are available in much higher densities compared to NOR Flash owing primarily to its lower cost per bit. NAND Flash memories typically comes in capacities of 1Gb to 16Gb. NOR Flash memories range in density from 64Mb to 2Gb. Because of its higher density, NAND Flash is used mainly for data storage applications.

Flash 101: NAND Flash vs NOR Flash - Embedded.com

- NAND flash has a much higher density of erase blocks than the NOR flash.
- In NAND flash architecture, the erase blocks are connected sequentially while, in NOR flash, those are connected in parallel.
- Access type of NAND is sequential while NOR has random access.
- Therefore, the read speed of NOR is faster than the NAND.
- The NOR flash has very slow erase speed compared to NAND flash, and the write speed of the NOR is also slow.

NAND vs. NOR, the verdict: Each flash type is indispensable. NAND is the workhorse of flash memory, widely used for bulk data storage in embedded systems and storage devices such as SSDs. But NOR flash plays a critical role in storing executable boot code and for applications requiring frequent random reads of small data sets.

Choose between NAND vs. NOR flash memory

NAND Flash chips are the black, rectangular blocks attached to the Printed Circuit Board (PCB) of your SSD (or any Flash-based product). Not to be confused with the DRAM Cache or Controller, NAND Flash chips are usually consolidated to one area of the PCB as shown below. NAND Flash memory cells are housed within NAND chips.

Flash memory is an electronic non-volatile computer memory storage medium that can be electrically erased and reprogrammed. The two main types of flash memory, NOR flash and NAND flash, are named after the NOR and NAND logic gates. The individual flash memory cells, consisting of floating-gate MOSFETs, exhibit internal characteristics similar to those of the corresponding gates.
